

METHOD AND SYSTEM FOR SETTING COMMUNICATION PARAMETERS ON NETWORK APPARATUS USING IC CARD

ABSTRACT OF THE DISCLOSURE

A method and system for performing an initial setting of communication parameters on a network apparatus with comparative ease and security maintained. The network system comprises a target device to be managed that is connected to a network, and a management device that manages the target device. The management device enables the target device to establish communications over the network and includes a first IC card drive in which an IC card stores communication parameters for allowing the management device to manage the target device, and the target device includes a second IC card drive for reading the communication parameters stored in the IC card to set the communication parameters that have been read.
